SUPERNOVA 1990L IN UGC 9927

J. Mueller reports her discovery of a supernova in UGC 9927 (R.A. = 15h34m.2, Decl. = +22° 40', equinox 1950.0). The supernova is 20" east and 2" south of the galaxy's nucleus and was at mag about 19 on a blue plate taken May 18 UT with the 1.2-m Oschin Telescope in the course of the second Palomar Sky Survey. S. Howell, Planetary Science Institute, reports that an observation made June 3.15 UT with the No. 1 Kitt Peak 0.91-m reflector (300-s CCD exposure) yields Harris V = 19.5 +/- 0.1; he gives the offset (+/- 1").0) as 18".4 east, 2" south. B. Leibundgut, B. Schmidt, and R. Marzke, Center for Astrophysics, report that a CCD observation on June 1.3 with the Mt. Hopkins 0.60-m telescope gives V about 18, and a spectrum obtained the same night with the Multiple Mirror Telescope confirms this as a type Ia supernova, closely resembling the 1981 May 10 spectrum of SN 1981B and indicating an age for SN 1990L of about 2 months past maximum.

COMET LEVY (1990c)

The following parabolic orbital elements, from 24 observations May 21-June 5, are still preliminary, the ephemeris position in mid-August being uncertain by at least 1 degree (the ephemeris has m1 varying as r to the inverse fourth power):

T = 1990 Oct. 24.359 ET	Peri. = 242.579			
	Node = 138.570 1950.0			
q = 0.93849 AU	Incl. = 131.623
